

Security Assessment Report

Automated Vulnerability Discovery

Target Infrastructure: <https://www.youtube.com/>

Date of Assessment: 2026-05-19 02:23 IST

Reference ID: 1917ad38-0090-4519-8755-dae1c09de11c

1. Executive Summary

This document presents the findings of an automated security assessment conducted against **<https://www.youtube.com/>** on 2026-05-19 02:23 IST. The assessment utilized the SmartFuzz testing engine to evaluate the target against a predefined set of vulnerability classes. The overall risk posture of the application is currently evaluated as **Critical**.

Assessment Metric	Value
Total Payloads Generated	936
Total Findings Confirmed	310
Critical Risk Findings	40
High Risk Findings	250
Medium Risk Findings	20
Maximum CVSS v3.1 Score	—
Average CVSS v3.1 Score	—

2. Authorization & Consent

Before this assessment was launched, the SmartFuzz operator was presented with a mandatory legal consent dialog. The scan only proceeded once the operator explicitly confirmed each of the following statements.

Confirmation Statements

1. I own this target, or I have written authorization from the owner.
2. I understand this scan will send potentially malicious payloads.
3. I accept full legal responsibility for the consequences of this scan.

Legal Reference — Information Technology Act, 2000

Unauthorized access to a computer resource, including the unauthorized scanning of computer systems for vulnerabilities, constitutes a punishable offence under the Information Technology Act, 2000 (India), **Section 43** (penalty for damage to computer, computer system, etc.) and **Section 66** (computer-related offences). Comparable statutes exist in most jurisdictions worldwide — notably the Computer Fraud and Abuse Act (United States), the Computer Misuse Act 1990 (United Kingdom), and the Council of Europe Convention on Cybercrime. SmartFuzz records the operator's authorization before each scan to ensure all testing activity is performed in compliance with applicable law.

5. Remediation Guidance

SSRF

1. Implement a strict allowlist of permitted destination domains, IP addresses, and protocols for any outbound server requests.
2. Actively block and reject network requests targeting internal, loopback, or reserved IP ranges (e.g., 10.0.0.0/8, 169.254.169.254, 127.0.0.1).
3. Disable HTTP redirection for server-side requests, or strictly re-validate the target URL against the allowlist after following any redirect.
4. Route all outbound application traffic through a dedicated egress proxy that explicitly drops internal network access.

RCE

1. Never pass user-supplied data directly to system shells or dynamic code evaluation functions (e.g., ``eval()``, ``exec()``, ``os.system()``).
2. Replace system command invocations with equivalent, safe language-native APIs (e.g., use ``os.mkdir()`` instead of executing ``mkdir`` in a shell).
3. If shell execution is completely unavoidable, strictly validate input against an allowlist and rigorously escape all arguments.
4. Run the application with the absolute minimum OS privileges required, and isolate the environment using containers (Docker) or jails (AppArmor).
5. Reference: OWASP Top 10 A03:2021 — Injection

XSS

1. Contextually output-encode all user-supplied data before rendering it in the browser (HTML, JavaScript, CSS, or URL contexts).
2. Implement a strict, restrictive Content-Security-Policy (CSP) HTTP response header to prevent the execution of inline scripts and untrusted sources.
3. Set the 'HttpOnly' and 'Secure' flags on all sensitive cookies (e.g., session tokens) to prevent theft via client-side scripts.
4. Sanitize any rich-text (HTML) input on the server side using a robust, actively maintained library (e.g., DOMPurify or Bleach).
5. Utilize modern frontend frameworks (React, Angular, Vue) that safely bind data to the DOM by default.
6. Reference: OWASP Top 10 A03:2021 — Injection

IDOR

1. Implement strict Authorization and Access Control checks on *every* request attempting to access, modify, or delete a resource.
2. Verify that the currently authenticated user session actually owns or has explicit permission to access the requested Object ID.
3. Replace predictable, sequential integer IDs with unpredictable, mathematically secure identifiers (e.g., UUIDv4 or GUIDs).
4. Ensure the API does not blindly trust client-provided IDs for operations affecting the current user's profile or financial state.
5. Reference: OWASP Top 10 A01:2021 — Broken Access Control

SQLi

1. Use parameterized queries (Prepared Statements) for all database access to strictly separate code logic from user data.
2. Utilize modern Object-Relational Mapping (ORM) libraries that automatically escape SQL inputs by default.
3. Enforce the Principle of Least Privilege (PoLP) on the database account used by the application (e.g., revoke DROP or ALTER permissions).
4. Implement strict input validation using allowlists for any user data that must be dynamically inserted into queries.
5. Deploy a Web Application Firewall (WAF) to detect and block common SQL injection signatures.
