4. Remediation Guidance

SSRF

1. Implement a strict allowlist of permitted destination domains, IP addresses, and protocols for any outbound server requests.
2. Actively block and reject network requests targeting internal, loopback, or reserved IP ranges (e.g., 10.0.0.0/8, 169.254.169.254, 127.0.0.1).
3. Disable HTTP redirection for server-side requests, or strictly re-validate the target URL against the allowlist after following any redirect.
4. Route all outbound application traffic through a dedicated egress proxy that explicitly drops internal network access.
5. Reference: OWASP Top 10 A10:2021 — Server-Side Request Forgery

RCE

1. Never pass user-supplied data directly to system shells or dynamic code evaluation functions (e.g., ``eval()``, ``exec()``, ``os.system()``).
2. Replace system command invocations with equivalent, safe language-native APIs (e.g., use ``os.mkdir()`` instead of executing ``mkdir`` in a shell).
3. If shell execution is completely unavoidable, strictly validate input against an allowlist and rigorously escape all arguments.
4. Run the application with the absolute minimum OS privileges required, and isolate the environment using containers (Docker) or jails (AppArmor).
5. Reference: OWASP Top 10 A03:2021 — Injection

XSS

1. Contextually output-encode all user-supplied data before rendering it in the browser (HTML, JavaScript, CSS, or URL contexts).
2. Implement a strict, restrictive Content-Security-Policy (CSP) HTTP response header to prevent the execution of inline scripts and untrusted sources.
3. Set the 'HttpOnly' and 'Secure' flags on all sensitive cookies (e.g., session tokens) to prevent theft via client-side scripts.
4. Sanitize any rich-text (HTML) input on the server side using a robust, actively maintained library (e.g., DOMPurify or Bleach).
5. Utilize modern frontend frameworks (React, Angular, Vue) that safely bind data to the DOM by default.
6. Reference: OWASP Top 10 A03:2021 — Injection
