## 4. Remediation Guidance

### SSRF

1. Implement a strict allowlist of permitted destination domains, IP addresses, and protocols for any outbound server requests.
2. Actively block and reject network requests targeting internal, loopback, or reserved IP ranges (e.g., 10.0.0.0/8, 169.254.169.254, 127.0.0.1).
3. Disable HTTP redirection for server-side requests, or strictly re-validate the target URL against the allowlist after following any redirect.
4. Route all outbound application traffic through a dedicated egress proxy that explicitly drops internal network access.
5. Reference: OWASP Top 10 A10:2021 — Server-Side Request Forgery

### XSS

1. Contextually output-encode all user-supplied data before rendering it in the browser (HTML, JavaScript, CSS, or URL contexts).
2. Implement a strict, restrictive Content-Security-Policy (CSP) HTTP response header to prevent the execution of inline scripts and untrusted sources.
3. Set the 'HttpOnly' and 'Secure' flags on all sensitive cookies (e.g., session tokens) to prevent theft via client-side scripts.
4. Sanitize any rich-text (HTML) input on the server side using a robust, actively maintained library (e.g., DOMPurify or Bleach).
5. Utilize modern frontend frameworks (React, Angular, Vue) that safely bind data to the DOM by default.
6. Reference: OWASP Top 10 A03:2021 — Injection

### IDOR

1. Implement strict Authorization and Access Control checks on *every* request attempting to access, modify, or delete a resource.
2. Verify that the currently authenticated user session actually owns or has explicit permission to access the requested Object ID.
3. Replace predictable, sequential integer IDs with unpredictable, mathematically secure identifiers (e.g., UUIDv4 or GUIDs).
4. Ensure the API does not blindly trust client-provided IDs for operations affecting the current user's profile or financial state.
5. Reference: OWASP Top 10 A01:2021 — Broken Access Control

### Info Disclosure

1. Sanitize and validate all user inputs.
